### **How to avoid the Classification Theorem of Finite Simple Groups in Asymptotic Group Theory**

**László Pyber**

**Hungarian Academy of Sciences, Rényi Institute (MTA Rényi), Hungary**

The Classification of Finite Simple Groups (CFSG) is a monumental achievement and a seemingly indispensable tool in modern finite group theory. By now there are a few results which can be used to bypass this tool in a number of cases, most notably a theorem of Larsen and Pink which describes the structure of finite linear groups of bounded dimension over finite fields. In a few cases more ad hoc arguments can be used to delete the use of CFSG from the proofs of significant results. The talk will discuss a very recent example due to the speaker: how to obtain a CFSG-free version of Babai's quasipolynomial Graph Isomorphism algorithm by proving a weird lemma about permutation groups.
